TRAFFIC IMPACT ASSESSMENT

To:

From: Steve Diebol, PE, PTOE

CC:

Date: August 7, 2017

Project #: J1840001

Introduction and Background

The purpose of this memo was to assess localized traffic impacts from a mixed-use development on the southwest corner of the intersection of SR66 (Jefferson Avenue) and Palmer Drive. This analysis focuses on proposed traffic generation and future intersection configurations, both temporary and permanent, compared to the background conditions without the development. Previous studies have evaluated the existing and background conditions and recommended improvements, and it is not the intent of this document to repeat those analyses.

The proposed development is anticipated to consist of three restaurants; two fast-food style and one sitdown style. Access will be provided by a new southwest leg to the intersection of SR 66 (Jefferson Avenue) and Palmer Drive. The site plan is shown on the right of this page. The Opening Year of the development is expected to be 2018, and the intersection was also evaluated for the Design Year (2038). The proposed Defiance Combined Middle School/High School building is under construction on Palmer Drive just north of the intersection and is expected to open to students on January 2018. A previous traffic study was performed for the school site and this document was the source of the background conditions traffic counts. The 2017 and 2037 "build" conditions traffic volume scenarios from the previous study were assumed to be representative of the 2018 and 2038 background conditions analyzed here.

The SR 66 (Jefferson Avenue) & Palmer Drive intersection is currently a 3 leg, one-way stop controlled intersection (southwestbound Palmer Drive has a stop sign) with a single lane in each direction at each approach. The previous school traffic study recommended signalization and added left turn lanes on all approaches. The City of Defiance instead prefers a roundabout to be installed at the intersection based on the Feasibility Study conducted in 2016 for a grant application which unfortunately did not receive a funding award. The City of Defiance has indicated they are currently considering the pursuit of construction funds for the roundabout possibly through an Ohio Public Works Commission (OPWC) grant/loan combination package, and if successful the funding could be available in July 2018 for construction. This study will evaluate the background and build traffic volumes under the existing intersection configuration; temporary signal control intended to be maintained until the roundabout can be installed; and the ultimate future roundabout configuration, and to recommend any changes to lane configurations or traffic control in order to adequately serve traffic.

THE MANNIK & SMITH GROUP, INC. J1840001.RPT.SAD.TrafficImpactStatement.docx

Site Trips

Peak hour site trips were estimated using the 9th Edition of the Institute of Transportation Engineer's (ITE) Trip Generation Manual. Pass-by reductions were also applied for the proposed land uses following the Trip Generation Handbook guidance. The directional distribution used to assign site trips to the adjacent roads were based on the volumes approaching and departing the three other legs of the intersection. The Trip Generation and Trip Distribution summaries are shown in Tables 1.1 and 1.2, respectively. Calculations are provided in the attachments to this memo.

Table 1.1 Trip Generation Summary										
REPORT OF THE PROPERTY OF THE		AM Peak Hou	r -		PM Peak Hou	ır				
Location / Trip Type	IN	OUT	TOTAL	IN	OUT	TOTAL				
Fast-Food Restaurant (1,500 sf)	42	39	81	37	34	71

	PM Peak Hour
Direction Location Entering From Exiting To	Entering From Exiting To
% Veh % Ve	eh % Veh % Ve
South SR 66 33 12 33 1	2 37 28 37 2
North SR 66 39 15 39 1	4 41 31 41 2
East Palmer Dr. 27 10 27 9	9 22 17 22 1

As shown in the table above, the development is expected to generate 224 new AM peak hour trips (117 inbound, 107 outbound) and 157 new PM peak hour trips (83 inbound, 74 outbound). The projected traffic volumes for this analysis are presented in Figure 1 located in the attachments.

Capacity Analysis

The capacity SR 66 (Jefferson Avenue) and Palmer Drive intersection was evaluated for the AM and PM peak hours for Opening Year (2018) and Design Year (2038) conditions. This analysis was conducted using Synchro for unsignalized (one-way and two-way stop control) and signalized control, and using Sidra for roundabout control. It should be noted that the capacity analysis from the previous study did not include Peak Hour Factor (PHF) analysis. Although typical ODOT analysis parameters allow use of default PHFs for design conditions, for this location considering the large amount of school traffic, it is appropriate and necessary to include PHFs in the capacity analysis to assure acceptable operations. The PHFs from the 2014 intersection counts were used for all analyses. Acceptable operations are defined as Level-of-Service (LOS) D or better following the Highway Capacity Manual criteria for LOS according to average vehicular delay. Below is a description of the scenarios that were analyzed for this study:

No Build with Existing Conditions: This scenario presents the intersection capacity results for the No Build traffic volumes (2014 traffic counts plus background growth and Middle School traffic from previous study – defined as background traffic volumes from this point forward) and the existing one-way stop control with existing lane configurations at the study intersection:

<u>Build with Existing Conditions</u>: This scenario presents the intersection capacity results for the Build traffic volumes (background traffic volumes <u>plus site traffic</u>) under two-way stop control with existing lane configurations and a two-lane approach for the site driveway (West leg / eastbound approach) of the study intersection;

THE MANNIK & SMITH GROUP, INC.
J1840001.RPT.SAD.Trafficimpactstatement.Docx

<u>No Build with Temporary Signal:</u> This scenario presents the intersection capacity results for the No Build traffic volumes (background traffic volumes) with the installation of a temporary, actuated, two-phase traffic signal and no changes to the existing lane configurations.

<u>Build with Temporary Signal:</u> This scenario presents the intersection capacity results for the Build traffic volumes (background traffic volumes <u>plus site traffic</u>) with the installation of a temporary, actuated, two-phase traffic signal and no changes to the existing lane configurations.

<u>Build Roundabout</u>: This scenario presents the intersection capacity results for the Build traffic volumes (background traffic volumes plus site traffic) with the installation of a roundabout and the required lane configurations for acceptable operations.

Table 1.3 presents a summary of the intersection capacity analysis for the scenarios described above. Capacity analysis output reports are provided in the attachments to this memo.

^{*-} Delay cannot be calculated, exceeds 1,000 seconds

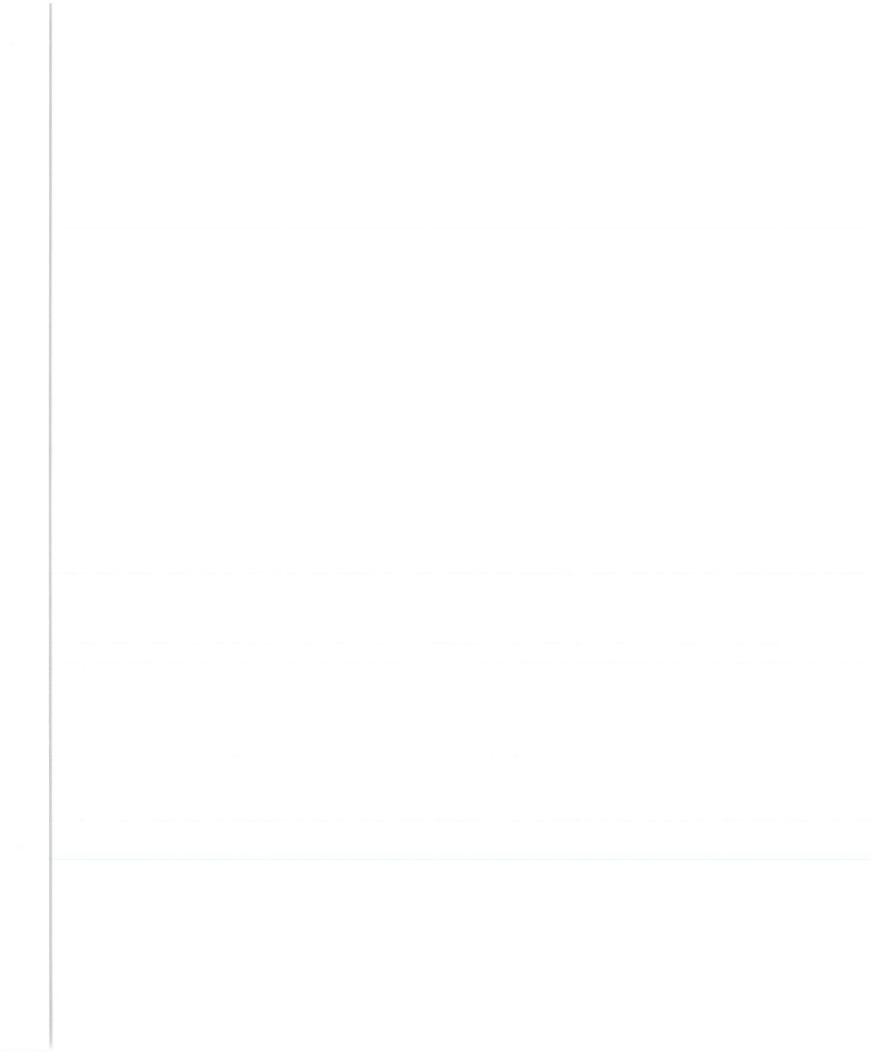

Discussion

As shown in the table above, neither the existing conditions (one or two way stop control) nor the temporary signal will adequately serve even the No Build traffic volumes. The addition of site traffic actually lessens the intersection delays because of pass-by reductions to critical movements which were already operating poorly (southbound left turn, westbound left turn). The primary cause of the failing operations is the high-demand southbound left-turn movement in the AM peak hour with a low PHF (0.56). Therefore, the temporary signal with existing lane configurations is not a viable short term solution until the roundabout can be installed. A temporary signal option with additional lanes (northbound and southbound left-turn lanes, and a westbound left turn lane) would result in adequate operations, however the expense of this installation would likely be greater than the roundabout option and it would be less safe than a roundabout and have more delay.

The Build Roundabout configuration necessary to adequately serve traffic demand consists of a single circulating lane and a single lane entry and exit on all legs except for the northbound approach, which will require a two-lane approach with a right-turn lane in the Opening Year (2018). A secondary design option would be to re-connect the existing Palmer Drive leg south

THE MANNIK & SMITH GROUP, INC.
J1840001.RPT.SAD.Trafficimpactstatement.Docx

3

NA - Not Applicable

of the bend to the west to connect with northbound SR 66 (Jefferson Avenue) as a one-way (northbound only) right turn bypass lane. It should be noted that this configuration would require a stop controlled approach to Palmer Drive on the east leg of the roundabout. As shown in the table, this roundabout configuration would operate acceptably in the Opening Year (2018), although the southbound approach would be at LOS D and at some point before the Design Year (2038) this approach would slip to LOS E (increase of only 3.4 seconds of delay). Given the minor increase in delay and the lack of conflicts for the queue (there is approximately 750 feet of storage from the roundabout to Hampton Avenue to the north, and the Design Year (2038) queue length is listed in the Sidra report as being 630 feet), it appears that the roundabout configuration is an acceptable long term improvement option for the intersection.

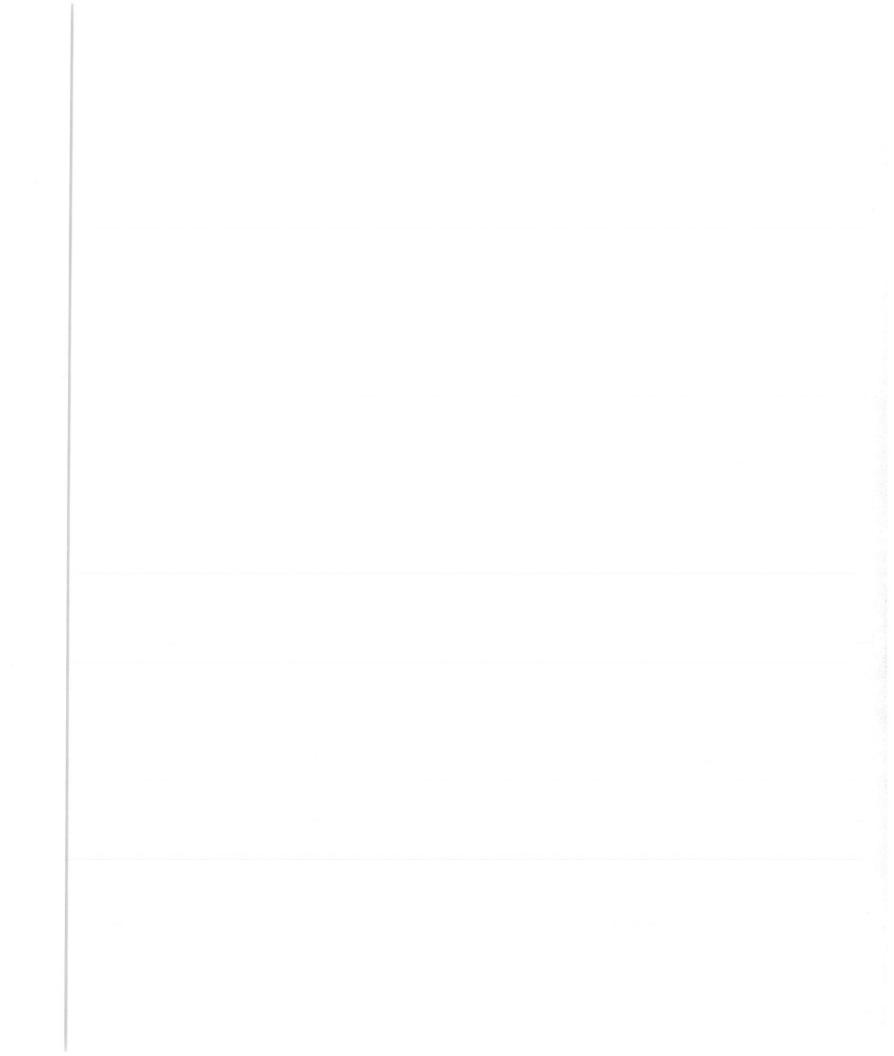

Conclusions

Upon analysis of the background conditions at the SR 66 (Jefferson Avenue) intersection with Palmer Drive considering the Peak Hour Factor, the intersection would operate at LOS F with no changes made to traffic control or lane configurations after the opening of the Defiance Combined Middle School/High School building in January 2018. The addition of site traffic from the proposed three-restaurant development would not significantly change the intersection delays or operations.

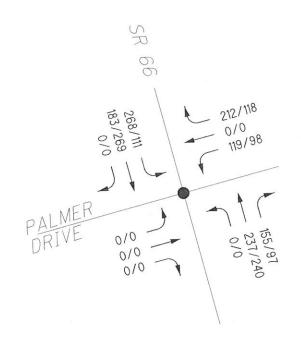

The analysis presented in this memo shows that while a temporary traffic signal without lane additions would provide an improvement to intersection operations compared to the existing conditions, it will still result in an overall LOS F with most approaches operating poorly. A single lane roundabout with single lane entries and exits except for an additional right-turn only lane on the northbound approach would provide acceptable overall operations in both the Opening Year (2018) and the Design Year (2038). It is recommended that the City seeks funding for the design and construction of the roundabout, possibly via the OPWC grant/loan program. If the OPWC funding option is not successful, there are also State Infrastructure Bank (SIB) loan programs for low interest loans/bonds as an alternative option. The poor operations of the intersection are a result of primarily the added traffic from the new school facility complex (per the results of the School Traffic Study and the Feasibility Study) and the proposed restaurants will add to the poor conditions. It is recommended that potential contributions from both the Schools and Developer be discussed with the City of Defiance to determine what is appropriate, as all parties (and the public) would benefit from the installation of a roundabout at this location that would allow traffic to function through the year 2038.

If the intersection were to be left as two-way stop control until the roundabout could be constructed, it is likely that the southbound left-turning traffic bound for the school complex would utilize other routes (Greenler Road to Cleveland Avenue to Palmer Drive) should delays become excessive and delays for the network would come to an equilibrium, though they would likely be LOS F. It is also recommended that the City closely monitor the intersection upon the opening of the Combined School facility to determine if the temporary signal or other means of traffic control (law enforcement officer directing traffic during school arrival and dismissal periods) is necessary for the short term. This may be an acceptable solution should the City desire to avoid the wasteful expenditures of a temporary traffic signal if the roundabout installation can be expedited.

Intersection	2058	2.0		0.902		20.8	LOSC	20.2	512.3				

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab). Roundabout LOS Method: Same as Sign Control.

Lane LOS values are based on average delay and v/c ratio (degree of saturation) per lane.

LOS F will result if v/c > 1 irrespective of lane delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all lanes (v/c not used as specified in HCM 6).

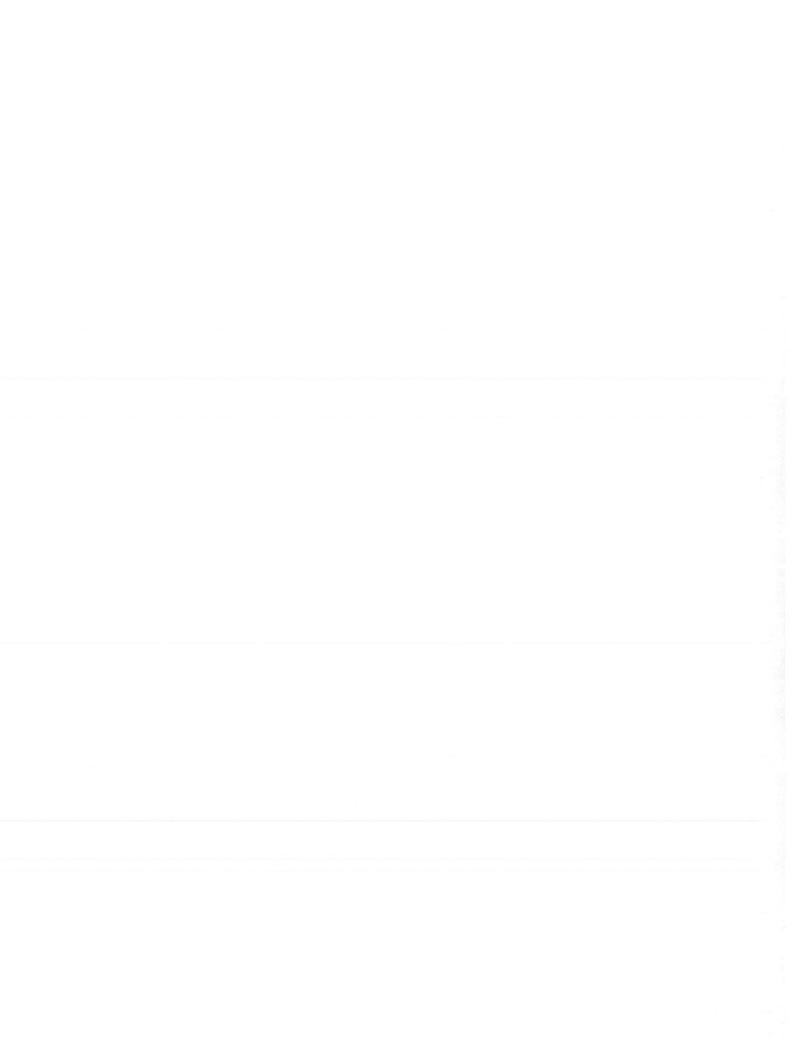

Roundabout Capacity Model: SIDRA Standard.

HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies. Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.
